HiggsfieldAi - clone

NOT proper cloning Higgsfield. I AM CLONING ONE
CORE USER JOURNEY.

User → Input → processing → Output

CORE USER JOURNEY

① User wants to create an Ai Video

② User enters a prompt

③ User optionally adds an image / reference

④ User choose the model / settings

4(A) Timings (4 sec → 30 sec) (Min to max)

4(B) Aspect ratio (21:9 to 9:16) (6 ratio)

4(C) Video Quality (480p to 1080p) (3 Quality)

4(D) Bitrate → High (less compression)
+ Large Size

Standard (more compression)
+ Smaller Size

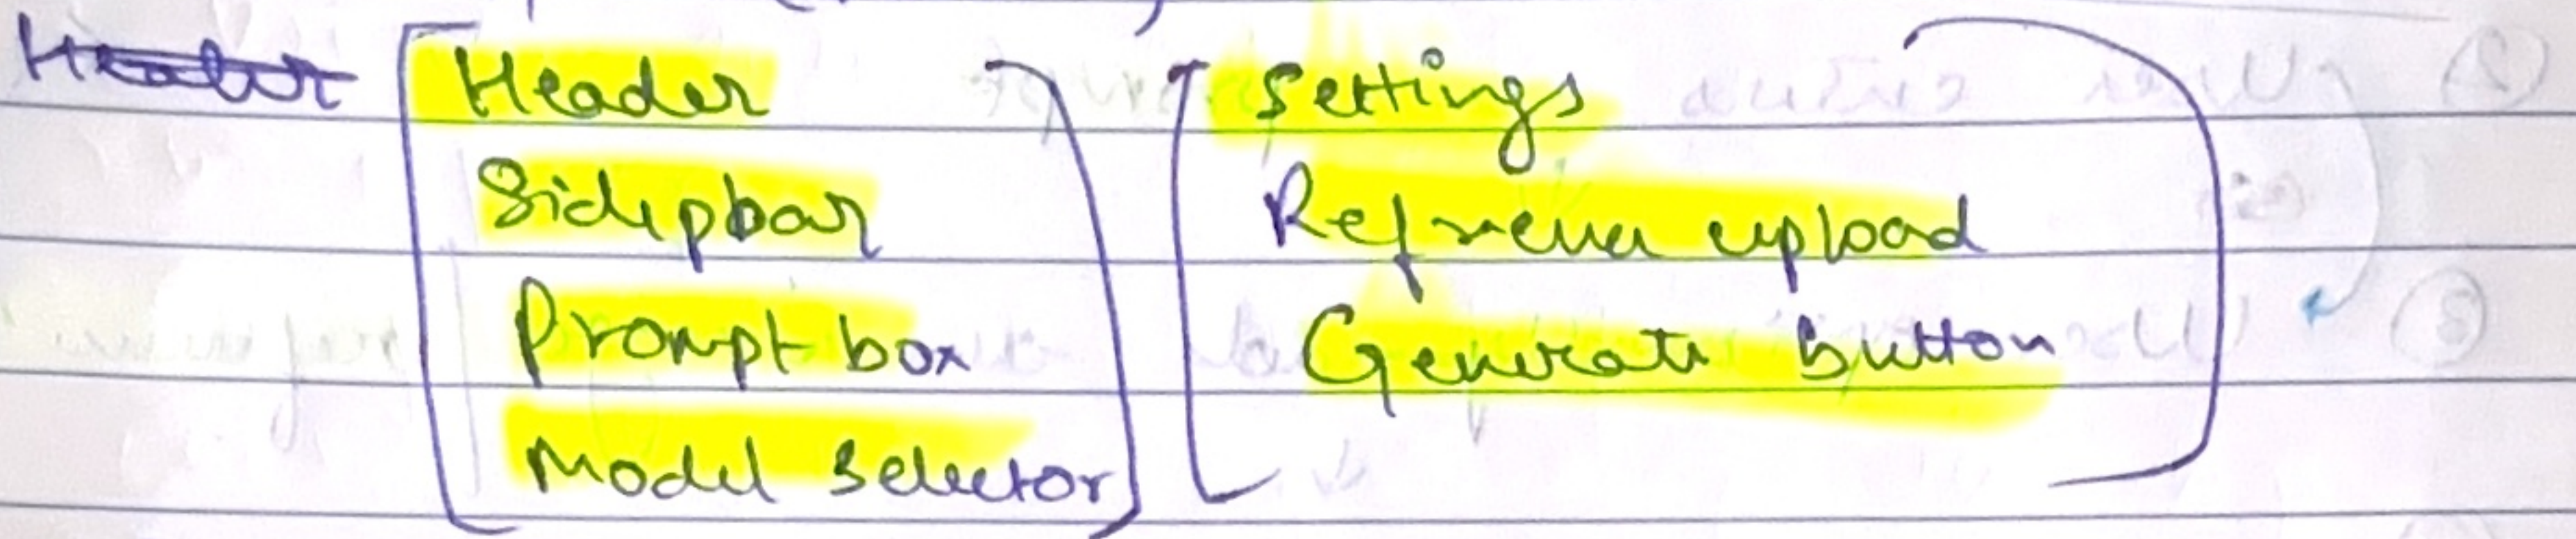

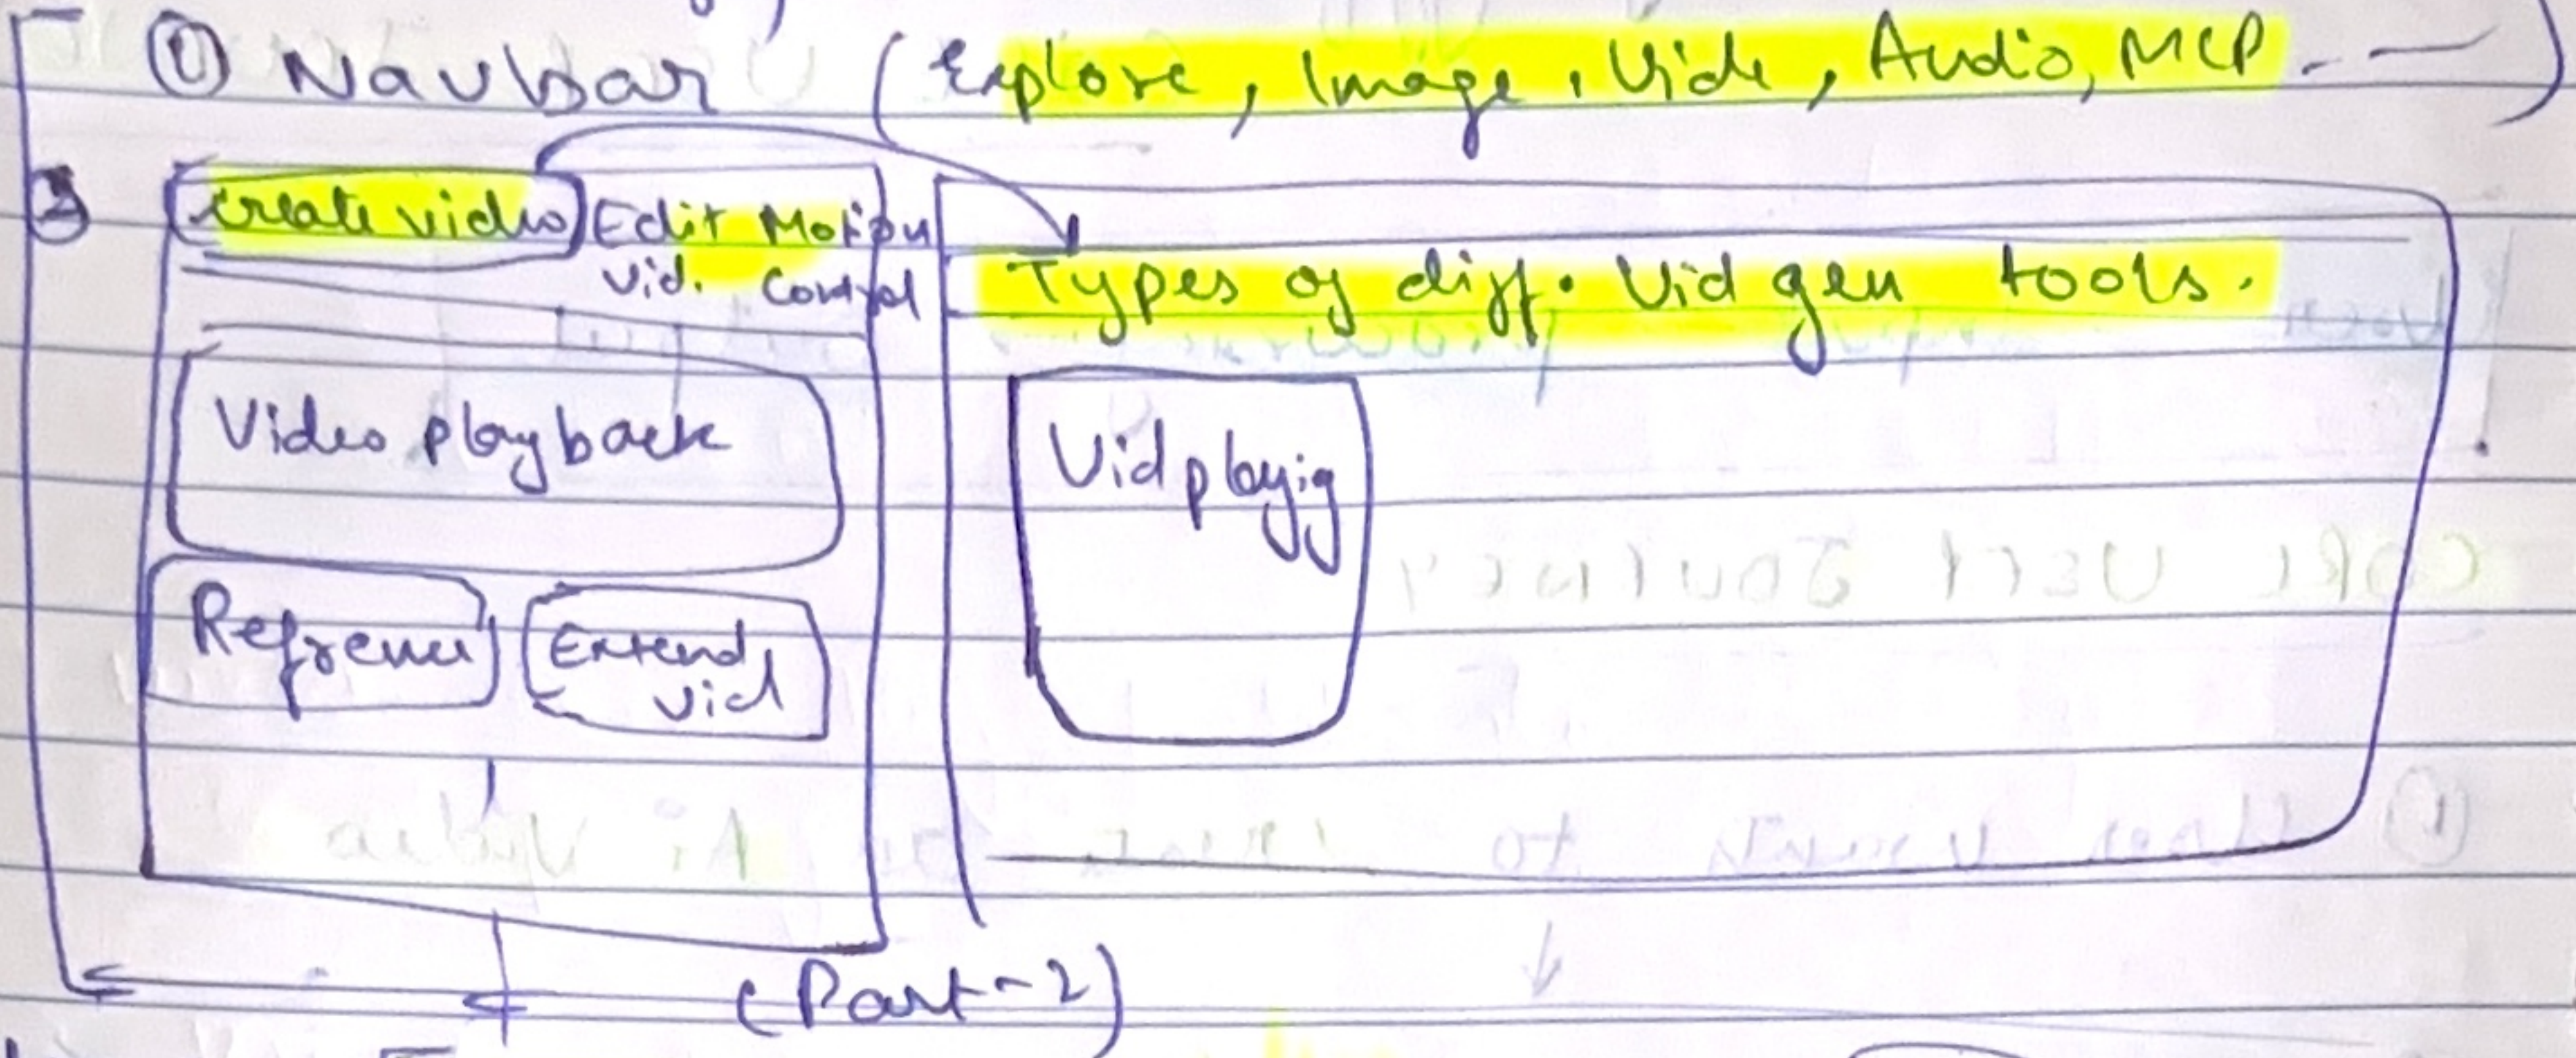

⑤ User click Generate → ⑥ System process request

→ ⑦ User review generated video → ⑧ User can
view/save/download/it.

SCREEN-1 (Empty State)

(what do I see?) (Part-1)

(Part-3)

Q. What is a trigger field what me to do?

→ If I am on create video.

① Add reference (Video/image/Audio)

② prompt → can add elements also use @ for reference

③ Model & Setting

④ Generate

(Part - 4)

Date

Model Selector

(After clicking it)

Drop down opens

different model appeared

Each model has info + Badges on Specific models [TOP, NEW, TOP]

Select one

Selected model appears in Input.

(Part - 5)

Analyzing the process.

"Something logically has to happen :

Frontend

↓
creates generation request

↓
Backend

↓
Validate input

Send request to AI model

↓
Generation takes time

↓
Backend receives result

↓
Store result

Front end gets status / result

↓
Display video

Date

Part - 6

IDLE

GENERATING

COMPLETED

IDLE

GENERATING

FAILED

↓
Retry

Q What does Higgsfield do while generation is happening?

→ We can still see the history,

→ with prompt

→ Everything works as before

→ and video is generating in bg.

What I am optimizing for:

Working product

product judgement

UX/UI quality

Speed of execution

clear architecture

polished core workflow.

* I am not trying to recreate Higgsfield platform, I am recreating one strong end-to-end user journey.

Part - 7

Date

Elements	What I observe	What it does.
prompt	Text prompt	User describe gen.
Model	Drop down	Select gen. model
Reference	Upload (area)	provides visual context
Settings	Duration / aspect ratio / resolution	controls output
Generate	Button	Starts generation + how much credits
Loading	UI State	shows processing
Result	Video (editable)	Generated output
Actions	Downloads / save / etc.	User handles output

My Main goal.

Prompt → Model → Settings → Generate
→ loading → result → History

Part - 8

What goes into the Backend :-

System Input → Processing → OUTPUT

Date

Input :-

- prompt
- model
- duration
- aspect-ratio
- resolution
- Bit-rate (Not necessarily)
- reference image

Then... processing :-

Validate request

Create generation job

Send to generation service

Track job status

Store result

Then Output :-

generation-id

Status

Video-url

created-at

metadata

NOTE: Internal Higgsfield implementation is unknown, This is my own backend design based on observed product behaviour.

Part-8

Date

Data Model (Generation OBJECT)

Generation

id
prompt
model
duration
aspect-ratio
resolution
reference-url
status
output-url
created-at

Possible statuses:-

→ Queued
→ generating
→ completed
→ Failed

Part-9,10 → MVP

MUST HAVE

→ prompt
→ Model Selection
→ Settings
→ Generate
→ Loading state
→ Result
→ History

→ Responsive UI
→ Deployment

NICE TO HAVE

- Multiple generation modes
- Advanced editing
- Extra Animation
- More models
- Advanced History filters
- Extra Settings.

NOT BUILDING

- Every Higgsfield feature
- Full clone of entire platform
- Feature that Don't contribute to core workflow.

Depth over breadth

One complete workflow is more valuable than any incomplete features.
